(13) Implementing Multilingual generative AI-cross lingual Rags →

(V1) Introduction →

→ Introduction to cross-lingual Retrieval →

→ Cross-lingual retrieval allows us to search and retrieve information across different languages by translating the source text into the target language using machine translation

→ Cross-lingual embeddings, which helps align data across languages, making retrieval more accurate.

(V2) Implementing Cross-Lingual Embeddings →

→ Cross-lingual embeddings involves utilising language agnostics models to encode text from different languages into a shared embeddi-ng space. allowing ~~embedding~~ semantic comparisons and retrieval across languages without needing translations

(V3) Building language-agnostics Rags.

→ Language agnostics representations, a technique that allows your rag system to retrieve information and multiple languages without the need for translation

③ Secure multiparty computations (SMPC) →

→ SMPC allows multiple people to work together and compute something using their privacy data without ever sharing the data itself.

→ Real-life Usecases →

① Bank jointly detect fraud without exposing customer data.

② Hospital collaborate on medical reserach while keeping patient data private, etc.

– In one line →

SMPC lets people compute a result together while keeping each persons input completely secrets.
